

Abstract of the Disclosure

A sectional refrigerator which comprises a plurality of cooling cabinets forming storage compartments with openings, and doors covering and uncovering the openings of the cooling cabinets, a cool air generating part generating cool air to refrigerate the storage compartments, and a cool air supplying part supplying the cool air generated in the cool air generating part into the storage compartments, wherein the plurality of cooling cabinets detachably connectable to each other in any orientation, forming a shape corresponding to a seating place of the sectional refrigerator. Thus, the present invention provides a refrigerator capable of change in size according to an area of a place for seating the refrigerator, and the present invention facilitates the utilization of the place the sectional refrigerator is seated on.
